

TAF TSI implementation in ad hoc TT tool for SŽDC – Czech IM

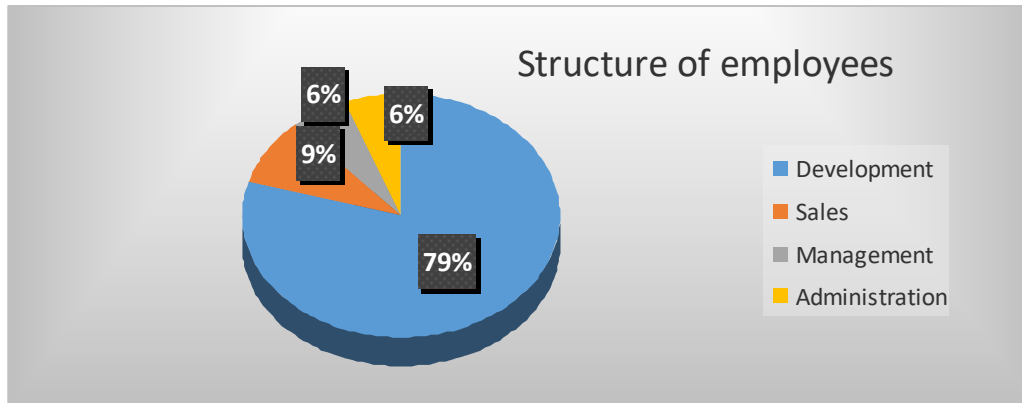

Ing. Marek Neustadt

Digitalisation Conference and Fair –
Budapest, 26. 10. 2016

Specialized software companies

- A Czech private group of specialized software companies
- Close and effective cooperation since 1993
- The main development background is based in the Czech Republic
- Own subsidiaries in Slovakia, Poland and Hungary
- Representations in Ukraine, Belarus, Russia

IT Systems for Transport and Logistics

- Software solutions for IM, RU and logistic operators
- Complex coverage of transport technology processes
- **Electronic data exchange in accordance with TAF TSI**
- **Telematics applications for planning, controlling, evaluating**
- Progressive technology of transport vehicles monitoring
- Wireless communications with crew of hauling vehicles

References

- More than 1000 customers in 25 countries
- Railway undertakings, operators and infrastructure managers, freight forwarders, carriers, shippers, universities, international associations and organizations etc.

In Czech Republic SŽDC – IM uses 2 IT systems for TT Construction:

- IS KANGO for yearly TT
- IS KADR for ad hoc TT

Why ?

At 2004 year Czech republic entered into EU

- Czech rail sector adopted a lot of new regulations and important are 3 terms:

**Capacity allocation
Network statement
Fee of use of Infrastructure**

From 2005 we have capacity allocation and capacity allocation fee

Czech IM needed IT system for solving this issue

Conditions:

- Every ad hoc train had to be calculated – capacity allocation fee
- We opened borders for international traffic for private RU's
- We didn't have extra new staff – only new OSS department 1+5
- We had yearly TT system which we couldn't use for it
 - IS works strictly for section by section TT construction
 - It was created for unique Railway company, it wasn't open for others RU's
 - IT system was in technical adaptation from file system to db client server architecture – The IT team didn't have any additional capacity for our needs

Czech IM decided to create a new IT system specially for ad hoc trains capacity allocation – IS KADR

- RU will do path requests in web page
- IM will create ad hoc paths and allocate capacity
- IT system will be prepared in accordance with split railway system
- IS KADR will take data from KANGO and put additional ad hoc paths
- TT construction will be between 1st and final point

**IS KADR was born and It is working from begin TT 2007
- 10. 12. 2006**

At 2008 year TT department was moved from ČD to SŽDC

Calculation of fee of use of infrastructure was bigger and bigger problem

- It was used statistic system which methodology was created at 1926
- This system had problem with correct detection particular train performance
- At 2009 was decided to create new IT system for calculation fee of use of infrastructure

Preconditions:

- System will automatically calculate fee on based data from planning and operation IT systems
- System these data collect automatically from defined data interfaces
- Users will solve only data conflicts

How to solve ?

Almost every running freight train had conflict with identity ...

SŽDC decided to implement TAF TSI:

- **objects TR ID, PA ID, PR ID**
- **processes**
- **messages**

The objects start at planning phase

→ we implemented objects into KADR

Objects description

- **Train – TR – object is created by RU**
 - Defined between **2 particular locations at Europe at 1 time for 1 or more days**
 - Based object for communication between RU and IM
- **Path Request PR – object is created by RU**
 - Object is used only in Path Request dialog
 - For **1 object TR you can have 1 – N objects PR**
 - Change of any train parameters means to create new object PR and also obligation to send new path request

Objects description

- **Path – PA – object is created by IM**
 - Object consists all TT data – path (locations and time) and train parameters allocated by 1 IM
 - For **1 object PR is possible to have 1 – N objects PA**
 - Change of any train parameters means to create new object PA – new TT for particular days
- **OTN – operational train number – 5 digits train number – allocated by IM**
 - It is only an attribute – no identifiers
 - It is held for staff and control system communication
 - On the SŽDC network is not allowed to use 2 same OTN – unique for GSM R

TR1 Hamburg (21:10) – Praha (1:35 +1) 3.3., 4.3.

PR1 Hamburg (21:10) – Schöna Grenze (23:50) 3.3., 4.3.

PR2 Děčín st.hr. (23:50) – Praha (1:35 +1) 3.3., 4.3.

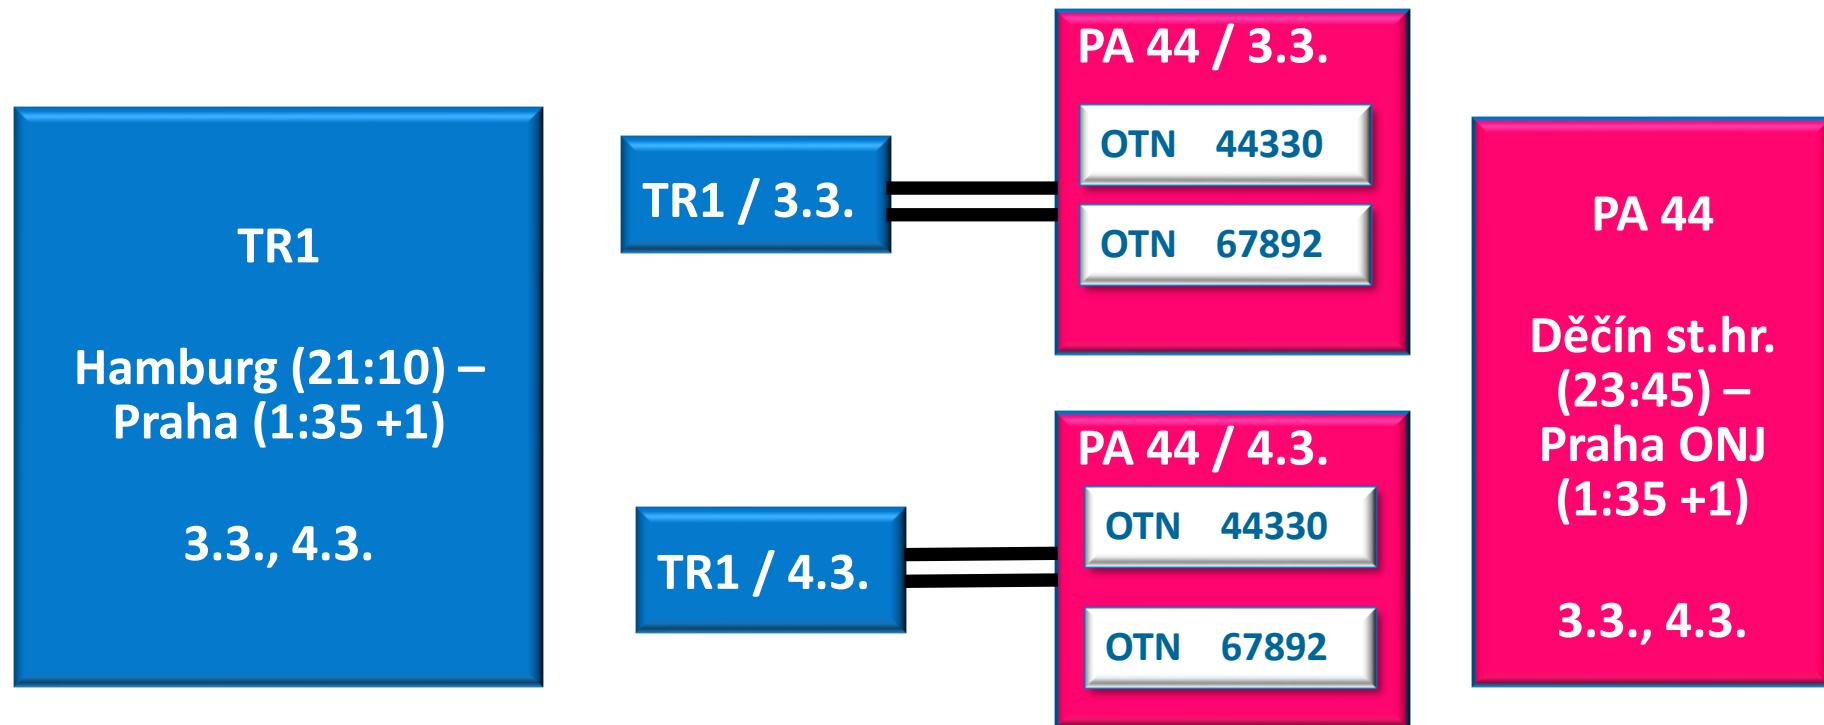

PA 44 Děčín st.hr. (23:45) – Praha ONJ (1:35 +1) 3.3., 4.3.

OTN 159 Děčín st. hr. (23:45) – Praha hl.n. (01:30) 3.3., 4.3.

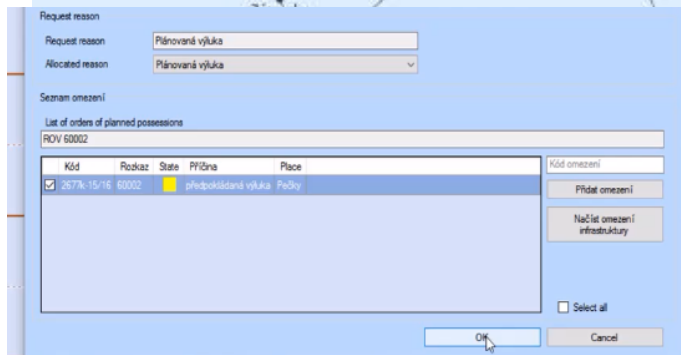

OTN 27159 Praha hl.n. (01:54 +1) – Praha ONJ (2:20 +1) 3.3., 4.3.

Relationships between objects – planning and daily form of objects

Impacts of objects methodology into KADR:

- System was complete rebuilt, now we can allocate more than 1 paths for 1 PR
 - We can solve problem with new path in case of accidents, planning or operational rerouting path
- System extended number of elements for full compatibility with TAF TSI, adopt code lists from TAF also and implemented data communication via TAF TSI messages version 2.1
- In system was created OTN reservation module – OTN is unique
 - GSM R reason

Transmission of TR ID and PA ID

Path Activation

Boundary between planning and daily form of object

- Information from RU – Train will go or not
- This information starts daily Train and path object
- It was pointed – it is crucial process

IS KADR is gate for IS SŽDC for this function

- web services
- web client

Transmission of TR ID and PA ID

Planning Form of Idents

Daily Form of Idents

From 2015 it was started in operation new integrated IT system of SŽDC

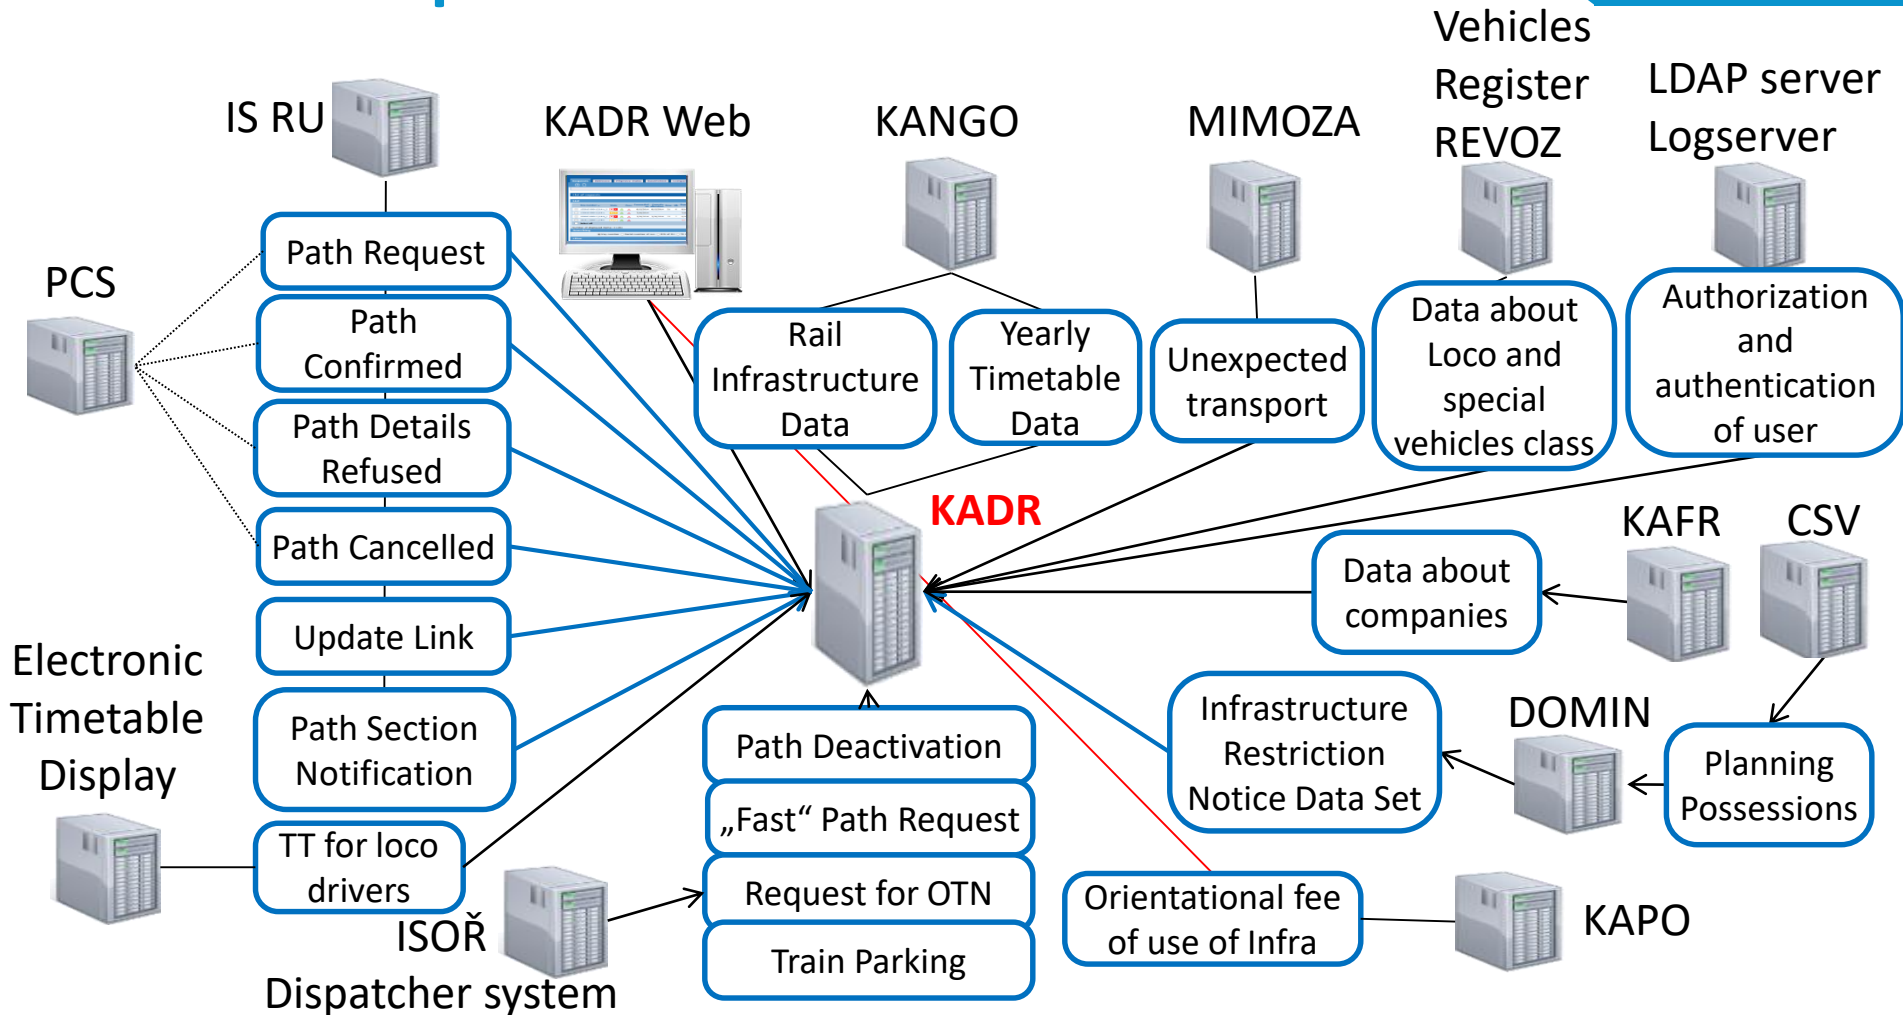

Main features:

- All data from common registers and code lists are used in all IT systems
- Every information is inserted only once
- Full data connection between all IT systems of SŽDC and IS of RU's
- Mutual data communication is on based TAF TSI rules

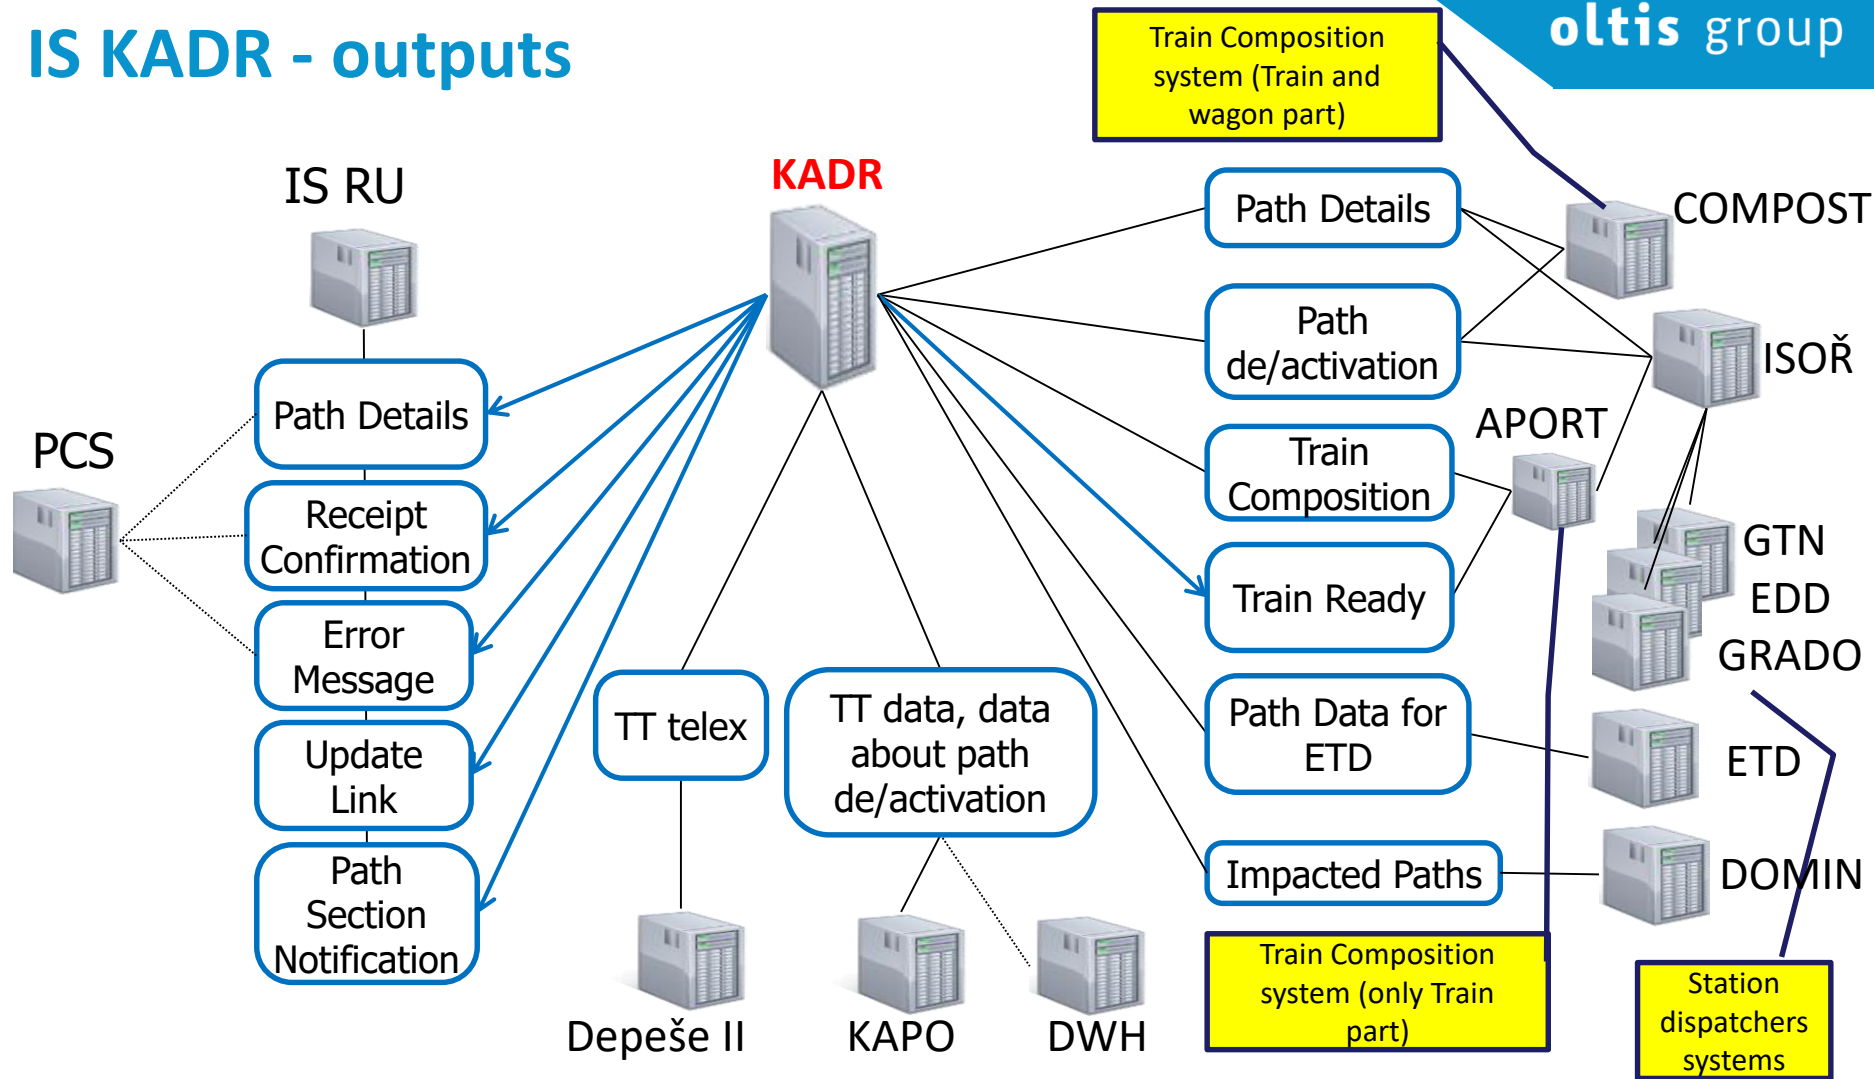

IS KADR:

- Is one from main IT part of IS SŽDC
- Is working in regime 7 x 24
- Number of mutual communications is very high

IS KADR - inputs

IS KADR - outputs

Next development for 2017

- **Implementation of international ad hoc paths via PCS – is in preparation**
- **Full implementation Path Not Available process**
- **To creation module for planning station tracks occupation**
- **To rebuilt work with Rail Infrastructure Description – automatically inputs of changes**
